YUITILITY.APP

DEEP ORGANIC SEARCH AUDIT

Fix discovery first. Earn rankings second.

A practical SEO recovery plan for turning 167 useful browser tools into a crawlable, trustworthy, search-ready product.

Audit date 26 September 2026
Public checks executed 25 September 2026 (UTC)

Scope Google + Microsoft Bing discovery, technical SEO, content quality, information architecture, authority and measurement.

The site cannot win clicks before search engines reliably discover and trust its pages

The strongest public signal is not a low click-through rate. It is near-zero observable search presence: sampled site: and exact-brand searches returned no Yuitility page, while the submitted sitemap exposes only four URLs for a product that says it has 167 tools.

PUBLIC SEARCH SAMPLE

0

Yuitility domain results surfaced for the sampled site: queries.

OBSERVED SITEMAP

4 URLs

Homepage, tools, blog and about only - all on the www host.

PRODUCT INVENTORY

167 tools

A real product base with crawlable directory links and a credible privacy angle.

> The first objective is not “rank position 1.” It is to make every worthwhile page consistently discoverable, index-eligible, accurate and worth choosing.

What is holding the site back

- × The XML sitemap represents only a small fraction of the indexable inventory.
- × Robots and sitemap references use www, while the preferred host must be proven and enforced consistently.
- × Template defects and mismatched FAQs damage relevance and quality signals.
- × Finance and health pages lack the visible sourcing and review controls expected for high-stakes topics.
- × The public mention sample found no meaningful independent authority beyond a developer GitHub reference.

What Yuitility can build on

- ✓ The tools directory gives crawlers paths to the inventory; these are not all orphan pages.
- ✓ Several calculator pages include formulas, worked examples, FAQs and related tools.
- ✓ “Runs in your browser; no upload” is a defensible differentiator.
- ✓ India-specific financial calculators create a narrower entry market than global head terms.
- ✓ Embeddable tools can become a legitimate distribution and link-acquisition loop.

Expected result of the plan: better crawl coverage, cleaner indexation signals, stronger page-level relevance and a growing pool of pages capable of earning impressions. No checklist can guarantee rankings; competition, authority, user satisfaction and search-engine decisions remain outside the site's control.

The evidence is strong enough to prioritize work - but not to invent missing metrics

This report separates observed defects from owner-only checks. That distinction matters: an unauthenticated audit can identify public crawl and content problems, but only Search Console, Bing Webmaster Tools, analytics and logs can show the full indexing story.

Area	Observed publicly	Owner verification required
Discovery	No domain result in sampled site: searches; brand query surfaced the developer's GitHub profile.	Google Search Console (GSC) Page indexing, Sitemaps and URL Inspection; Bing index coverage.
Crawl directives	robots.txt allows the site, blocks API/private/embed paths, and points to a www sitemap.	Googlebot live test, server status codes, redirect chains and log-file crawl frequency.
Sitemap	Four URLs only; all use https://www.yuitility.app/....	Generated route inventory, submitted sitemap status, errors, discovered URL count and true lastmod values.
Content	Sampled tool/category/blog pages, template defects, thin articles and inaccurate/mismatched copy.	Full 167-page crawl, calculator test suite, editorial review and rendered mobile checks.
Authority	Public searches found only a developer GitHub reference as a relevant independent mention.	A commercial backlink index and GSC/Bing link reports for a complete referring-domain count.
Performance	No verified PageSpeed Insights, Lighthouse or Chrome UX Report numbers were obtained.	Run lab tests by template and monitor field Core Web Vitals as data becomes available.

Sampled public surfaces

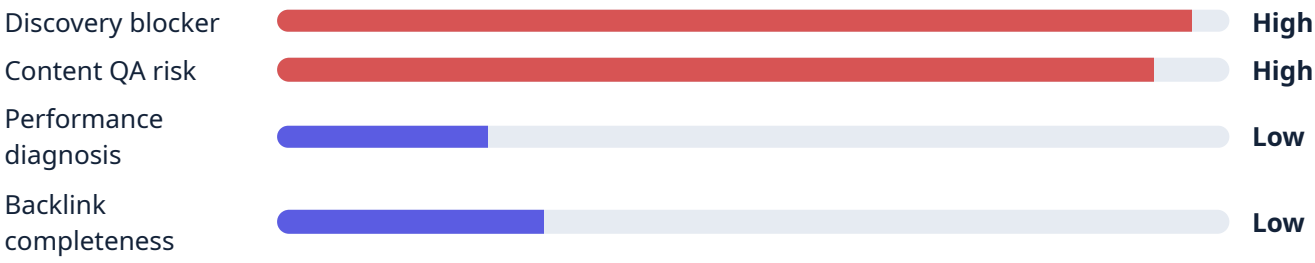

Homepage, tools directory, blog, about, finance and PDF category pages; EMI, SIP, salary, age, pregnancy, standard calculator, PDF merger, image compressor and JSON formatter tools; seven visible blog posts.

Interpretation rule

A public site: query is a directional check, not an index census. Treat the “zero” as a red flag to investigate in GSC, not as proof that Google has stored exactly zero URLs.

Important correction: the missing sitemap entries do not make all 163 omitted tools “orphans.” The /tools directory links to the inventory. The precise defect is incomplete sitemap coverage; crawl depth and internal-link equity require a full crawl.

Decision confidence

Confidence indicates strength of available evidence, not a ranking score.

One canonical host and a complete sitemap are the fastest high-confidence fixes

The current signals are internally inconsistent: robots.txt points to a www sitemap and the observed sitemap contains only four www URLs. Select one host only after verifying real redirects and canonical tags, then align every signal.

1. Choose
Pick apex or www from the actual production redirect/canonical behavior.

2. Enforce
One-hop 301 from the alternate host; HTTPS only.

3. Declare
Self-canonical, sitemap, Open Graph, schema and internal URLs all match.

4. Verify
Inspect representative URLs in GSC and Bing.

Recommended robots.txt

```
User-agent: *
Allow: /
Disallow: /api/
Disallow: /private/
Disallow: /embed/

Sitemap: https://yuitility.app/sitemap.xml
```

Use the apex example only if testing confirms it is the preferred host. Google's crawler does not rely on the non-standard Host: directive; removing it avoids a contradictory hint.

Every indexable route must resolve cleanly

- ✓ Returns HTTP 200 without a redirect chain.
- ✓ Has no noindex and is not blocked by robots.
- ✓ Has one self-referencing canonical on the preferred host.
- ✓ Renders its primary content and links without user interaction.
- ✓ Appears in the XML sitemap only if canonical and index-worthy.
- ✓ Is linked from at least one crawlable hub or related page.

The sitemap should reflect the real inventory

URL class	Observed/claimed count	Include?	Rule
Core pages	4	Yes	Homepage, tools, blog, about if each is canonical and useful.
Tool pages	167 claimed	Selective yes	Include after content and functional QA; omit/noindex weak duplicates until fixed.
Category hubs	8 observed categories	Yes	Only if each has unique explanatory copy and crawlable tool links.
Blog posts	At least 7 visible	Selective yes	Include substantial, original posts; consolidate or noindex thin entries.

Potential inventory: roughly 186 URLs before pagination or other routes (4 core + 167 tools + 8 categories + 7 articles). The exact number must come from the deployed route registry, not this arithmetic.

Generate search signals from one route registry so they cannot drift

Manual sitemaps and per-page metadata do not scale to 167 tools. Put indexability, canonical URL, title, description, category, modification date and structured data under one version-controlled page model.

Route record (framework-agnostic)

```
{
  "path": "/tools/emi-calculator",
  "indexable": true,
  "canonicalHost": "https://yuitility.app",
  "title": "EMI Calculator India - Payment & Amortization | Yuitility",
  "description": "Calculate monthly loan EMI, total interest and repayment schedule...",
  "category": "/category/finance",
  "lastModified": "2026-09-26",
  "reviewedBy": "qualified reviewer id"
}
```

HTML head output

```
<link rel="canonical"
 href="https://yuitility.app/tools/emi-calculator">
<meta name="robots"
 content="index,follow,max-image-preview:large">
```

Sitemap output

```
<url>
 <loc>https://yuitility.app/tools/emi-calculator</loc>
 <lastmod>2026-09-26</lastmod>
</url>
```

Only set lastmod when the page's primary content or functionality materially changed. Do not update every URL on every build.

Release gate for every deploy

Automated check	Fail the build when...	Evidence to store
Canonical parity	Sitemap URL, rendered canonical and final 200 URL do not match exactly.	URL, status, redirect chain, canonical.
Indexability	An indexable route has noindex, is robots-blocked, or canonicalizes elsewhere.	Robots meta/header and robots match.
Rendered content	Title, one visible H1, primary copy or related links are absent after rendering.	Rendered HTML snapshot.
Uniqueness	Title/H1/description duplicates another route or boilerplate exceeds the useful content.	Duplicate clusters.
Structured data	JSON-LD is invalid, unsupported, or contradicts visible content.	Validator result and schema types.
Function test	Known calculator/tool input does not produce the expected output.	Test case and expected value.

> **Avoid a common "fix":** do not canonicalize every tool to /tools. Each genuinely distinct, indexable tool needs its own self-canonical. Consolidate only pages that satisfy the same intent and cannot justify separate value.

Crawl paths exist; stronger hubs should concentrate meaning and internal authority

The /tools directory exposes many tool links, so the inventory is not simply orphaned. The next job is to make hierarchy explicit: category hubs should explain a topic, list every relevant tool, connect to supporting guides and pass context through descriptive anchors.

Homepage
Lead with value proposition and 6-10 priority clusters, not only a paginated tool grid.

Category hub
Unique introduction, use cases, comparison table, all tools, supporting guides.

Tool page
Intent answer, working tool, method, examples, limits, sources, related links.

Guide
A real task walkthrough that links to the exact tool at the useful moment.

Required link modules

- ✓ Breadcrumbs on category, tool and article pages.
- ✓ “Related calculators/tools” chosen by task, not random rotation.
- ✓ “Learn how it works” guide links from tools.
- ✓ Contextual tool links inside guides, with descriptive anchors.
- ✓ Category footer listing every relevant tool in plain HTML.
- ✓ Canonical pagination links or a crawlable “view all” directory.

Anchor text examples

Avoid	Prefer
Click here	calculate your monthly EMI
Use this tool	merge PDF files in your browser
Related tool	validate and format JSON locally
Learn more	understand SIP return assumptions

Strengthen category hubs instead of creating more thin pages

Hub	Primary job	Useful supporting content
India finance	Help users choose the right calculator and understand inputs.	EMI vs flat interest; SIP assumptions; salary components; tax-year change log.
PDF privacy	Explain local processing, limitations and supported files.	Browser memory limits; page ordering; encryption handling; tested browsers.
Developer text	Organize formatters, encoders and validators by workflow.	Valid vs invalid JSON; Unicode behavior; large-input benchmark.
Image utilities	Connect format, size, quality and privacy use cases.	Before/after samples; metadata behavior; browser compatibility.

Crawl-depth target: every priority page reachable from the homepage in two clicks and every indexable page reachable in three. Measure this with a full crawl; do not infer it from the sitemap alone.

Quality-control failures are now a domain-level trust risk

The product has genuine utility, but multiple pages expose template leakage and factual mismatches. On finance and health topics, these errors are not cosmetic: they can make the entire site appear mass-generated and insufficiently reviewed.

Priority	Observed example	Why it matters	Required fix
P0	Salary page states Section 87A applies up to ₹7,000,000.	A severe value/zero or tax-year error on a financial calculator can cause real user harm.	Remove the statement now; re-derive rules by financial year and regime from official sources, then unit-test boundaries.
P0	Pregnancy due-date FAQ references Mifflin-St Jeor and US Navy formulas.	Those methods are unrelated to due dates; the mismatch demonstrates template contamination.	Replace with clinically appropriate method, limitations and a qualified medical review.
P0	Age calculator FAQ discusses watermarks, uploads, image formats and batch processing.	The content does not answer the page intent and weakens perceived quality.	Delete the wrong FAQ; write age-specific boundary cases and date conventions.
P1	Standard calculator says precision is “guaranteed.”	Absolute accuracy claims conflict with normal floating-point limitations.	Document precision, rounding and known limits with test examples.
P1	Steps render as “1. 1”, “2. 2”, “3. 3”.	Visible template artifacts signal low editorial care across many pages.	Fix list rendering and scan every route for duplicated ordinal text.
P1	Blog equations expose broken TeX-like fragments such as ext and imes.	Search-visible text becomes confusing and the explanation may be unusable.	Render formulas as accessible HTML/MathML plus readable text fallback.
P2	Generic “Was this calculator accurate?” appears on non-calculator tools.	Repeated boilerplate dilutes page-specific relevance.	Use component labels and FAQs by tool type; remove filler.

Freeze before expansion

Pause net-new finance and health pages until existing outputs, copy, assumptions and edge cases pass human review. More unreviewed pages increase risk faster than traffic potential.

Publish a quality contract

Show method, inputs, test cases, source links, owner, last-reviewed date, change history and a correction route on every high-stakes page.

Every priority page needs a testable reason to exist beyond the widget

A working tool is the core value, but search landing pages also need enough visible context for users and crawlers to understand the task, verify the result and choose the next step.

Recommended page sequence

1. One H1 that names the exact job.
2. Two-sentence promise and privacy statement.
3. The working tool above the fold.
4. Result explanation, units and rounding.
5. Method/formula or processing behavior.
6. One worked example with verified output.
7. Limits, edge cases and supported formats.
8. Sources/reviewer for finance or health.
9. Intent-specific FAQs and related pages.

Sample title + H1 pairs

EMI
<title> EMI Calculator India - Payment & Amortization | Yuitility
<h1> EMI Calculator for Indian Loans

PDF merger
<title> Merge PDF Files Privately in Your Browser | Yuitility
<h1> Merge PDFs Without Uploading Them

JSON
<title> JSON Formatter & Validator - Private Browser Tool | Yuitility
<h1> Format and Validate JSON Locally

Minimum functional test suite

Tool class	Must test	Must disclose
Finance calculators	Zero/negative inputs; rate boundaries; annual/monthly conversion; rounding; tax-year transitions.	Formula, compounding frequency, tax regime/year, exclusions, source and review date.
Date/health	Leap years; time zones; invalid dates; boundary weeks; medically unusual inputs.	Method, uncertainty range, non-diagnostic status, qualified review and emergency disclaimer where relevant.
PDF/image	Corrupt files; encryption; order; page count; large files; unsupported formats; metadata.	Whether bytes leave the device, browser limitations, file-size limits and retention behavior.
Developer tools	Invalid syntax; Unicode; huge input; whitespace; escaping; copy/download fidelity.	Standards/version, input limits, transformations and whether content persists.

Replace generic claims

- × “Precision is guaranteed.”
- × “Most PDF mergers…”
- × “100% secure” without a testable threat model.

With auditable language

- ✓ “Results are rounded to two decimals; see method and test cases.”
- ✓ “Processing occurs in this browser session; verify in DevTools/network tests.”
- ✓ “Tested on current Chrome, Firefox and Safari with files up to the documented limit.”

Sample finding: in fetched rendered text, the EMI, JSON formatter and pregnancy pages did not expose a clear visible H1 while six other sampled tools did. Verify all templates in the browser and enforce exactly one H1 in the release gate.

Focus 10-20 pages where Yuitility has a defensible advantage

Trying to make 167 pages rank at once will spread review, links and internal authority too thin. Start with a small set that combines clear demand, credible differentiation and the ability to produce materially better content than existing results.

Cluster	Why Yuitility can win	Priority page pattern	Proof asset
India finance	Local terminology and calculation context.	EMI, SIP and salary pages after expert review; year/regime-specific guides.	Formula tests, official citations, downloadable schedules.
Private PDF	Browser-only processing is meaningful for sensitive documents.	Merge, split, compress and extract tasks framed around no-upload workflows.	Network test, supported-file matrix, browser benchmark.
Private image	Local handling plus visual before/after evidence.	Compress/convert/resize pages by format and outcome.	Quality-size comparison using original test images.
Developer text	Fast, local utilities can serve precise intent.	JSON validation/formatting, encoding and diff pages with standards-aware behavior.	Edge-case corpus, Unicode tests, performance limits.

Do not lead with the hardest head terms

AVOID INITIALLY

“EMI calculator”
“PDF merger”
“image compressor”

These broad terms are crowded by banks, major software vendors and long-established tool sites.

BUILD TOWARD

Task + constraint + audience

Examples: compare reducing-balance loan EMI; merge confidential PDFs without upload; validate large JSON locally; compress WebP to a target size.

A page earns indexation when it adds something specific

- ✓ **Original evidence:** benchmark, test corpus, screenshot, downloadable example or reproducible calculation.
- ✓ **Decision support:** explains when to use the tool, what assumptions change the result and what to do next.
- ✓ **Trust:** real author/reviewer, source links, review date and corrections path.
- ✓ **Distinct intent:** serves a query that another Yuitility page does not already satisfy.

> **Editorial rule:** if a thin blog post only paraphrases the tool and adds no tested procedure, merge its useful lines into the tool page or noindex it until it becomes original. Do not publish to hit a frequency target.

Use schema to clarify real entities - not to manufacture rich results

Structured data can improve understanding and eligibility for enhanced presentation, but it is not a ranking shortcut. Mark up only information visible on the page and supported by Google's current documentation.

Recommended types

Surface	Markup
Sitewide/core	Organization and WebSite with consistent name, URL, logo and genuine profiles.
Hierarchy	BreadcrumbList matching visible breadcrumbs.
Editorial guides	Article with real author, dates and publisher.
Tools	WebApplication or SoftwareApplication only when attributes are accurate and visible.

Do not add

- × Fake aggregate ratings or self-authored review stars.
- × FAQ markup for questions not visible on the page.
- × Medical/financial credentials that cannot be substantiated.
- × Schema URLs that point to a different host than the canonical.
- × Multiple conflicting objects describing the same page.

FAQ rich results are restricted mainly to authoritative government and health sites. Keep useful FAQs for users; do not build a traffic forecast around FAQ markup.

Minimal tool-page JSON-LD pattern

```
{
  "@context": "https://schema.org",
  "@type": "WebApplication",
  "name": "EMI Calculator",
  "url": "https://yuitility.app/tools/emi-calculator",
  "applicationCategory": "FinanceApplication",
  "operatingSystem": "Any modern web browser",
  "isAccessibleForFree": true,
  "description": "Visible, page-specific description"
}
```

The exact type and properties should follow current supported policies and the visible product. This example is a starting model, not evidence of rich-result eligibility.

Validation sequence

Source
Generate JSON-LD from the same route data as title and canonical.

Render
Confirm one valid JSON object survives client rendering.

Test
Run Google's Rich Results Test and a schema.org validator.

Monitor
Watch Search Console enhancements; fix regressions.

Entity signal: the brand term is noisy because “yuitility” is also used elsewhere as a handle/product term. Consistent Organization/WebSite markup, real profiles, an identifiable team and independent mentions help search engines disambiguate the product.

Measure template performance before fixing what may not be broken

No reliable PageSpeed Insights or Core Web Vitals result was available for this audit. Do not invent a score. Establish a repeatable baseline across representative templates, then prioritize measured bottlenecks behind indexing and content accuracy.

LARGEST CONTENTFUL PAINT
≤ 2.5 s
Good target at the 75th percentile.

INTERACTION TO NEXT PAINT
< 200 ms
Keep tool interactions responsive.

CUMULATIVE LAYOUT SHIFT
< 0.1
Reserve space for results, ads and async UI.

Run a five-template test matrix

Template	Representative URL	Test interactions
Homepage	/	Initial render, tool-grid pagination/search, menu.
Directory/category	/tools, /category/finance	Filter, link visibility, long list rendering.
Calculator	/tools/emi-calculator	Input latency, recalculation, chart/table rendering.
File processor	/tools/pdf-merger	File selection, processing, progress and large input.
Article	One substantial blog post	Typography, equations, images and related links.

Field data

Chrome UX Report data reflects real users over time and should drive the final Core Web Vitals judgment. A new or low-traffic domain may have no page-level field data yet.

Lab data

Lighthouse/PageSpeed lab runs are repeatable diagnostics. Record mobile and desktop results after each major template change, but do not optimize the 0-100 score at the expense of usability.

Likely checks for browser-based tools

- ✓ Lazy-load non-critical calculators, charts and PDF/image libraries; keep the tool's first task fast.
- ✓ Move expensive processing to a Web Worker where measurement shows main-thread blocking.
- ✓ Split code by tool route so one utility does not ship every tool's dependencies.
- ✓ Reserve result-panel dimensions to prevent layout shift; compress and size all images.
- ✓ Server-render or pre-render meaningful titles, H1s, descriptions and internal links.

> **Priority order:** repair crawl/index signals and factual defects first. A perfect Lighthouse score cannot make a missing, low-trust or non-indexed page rank.

Search engines need independent reasons to trust and cite the product

The public mention sample found no meaningful independent references beyond a developer GitHub profile/commit. That is not a complete backlink count, but it is enough to reject “publish more generic posts” as the primary growth strategy.

Create assets worth citing

- ✓ **Benchmarks:** compare local-browser processing time and limits across devices and browsers.
- ✓ **Test corpora:** publish anonymized JSON edge cases, image compression samples or formula unit tests.
- ✓ **Transparent methodology:** document exactly how each calculator or transformation works.
- ✓ **Useful embeds:** let educators and publishers embed a focused tool with optional, visible attribution.
- ✓ **Update notes:** publish material changes to tax rules, calculation logic and supported formats.

Targeted outreach

- Indian finance educators, payroll and tax writers - only after expert review.
- Privacy/security communities evaluating local-first tools.
- Developer newsletters and teaching resources needing reliable utilities.
- University/library resource pages where a tested tool genuinely fits.
- Curated tool directories with editorial standards, not mass-submission farms.

> **Link standard:** earn editorial links because the page is useful. Do not require keyword-rich anchors, hide attribution, exchange links at scale or turn embeds into a manipulative backlink scheme.

Microsoft Edge is a browser; Bing is the search engine to configure

Action	Implementation	Meaning
Verify site	Add the preferred host to Bing Webmaster Tools, ideally with durable domain verification.	Unlocks Bing crawl, index and query diagnostics.
Submit sitemap	Submit the same canonical sitemap used for Google.	Communicates inventory; does not guarantee indexing.
Inspect URLs	Check homepage plus representative category, tool and article URLs.	Separates discovery, crawl, canonical and quality issues.
Use IndexNow	Optionally notify participating engines when a URL is added, materially updated or deleted.	A change notification, not a ranking boost or indexing command.

First outreach package

Proof page	Evidence asset	Recipient fit	Pitch
One flagship tool with methods, tests and transparent limits.	Original benchmark or downloadable reference.	20-30 hand-picked sites that already cover the exact problem.	Explain the useful evidence; do not ask for a “dofollow backlink.”

Remove indexation and trust blockers before pursuing growth

The first week should end with one coherent host, a clean indexable inventory, corrected high-risk content and verified submission to both major webmaster platforms.

Day	Deliverable	Acceptance criterion	Owner
0-1	Remove the salary tax statement; correct age and pregnancy FAQs; remove “guaranteed” precision and duplicated list numbers.	Production and cached rendered HTML no longer expose the defects.	**Content + domain expert**
1-2	Confirm preferred host using redirects, canonicals and live URL tests; implement one-hop 301.	HTTP, alternate host and path variants resolve to one 200 URL; self-canonical matches.	**Engineering**
2-3	Generate complete sitemap from reviewed indexable routes; align robots.txt.	Every sitemap URL is 200, canonical, indexable and on the preferred host; no excluded URLs.	**Engineering**
3-4	Verify GSC domain property and Bing site; submit sitemap to both.	Sitemap accepted without fetch/parse errors; discovered count is plausible.	**Site owner**
4-5	Inspect homepage, /tools, one category, three flagship tools and one article.	Live tests show crawl allowed, 200, rendered content and intended canonical.	**SEO + Engineering**
5-7	Request indexing for homepage plus 5-10 strongest pages; launch page-level QA spreadsheet.	Requests accepted; every indexable URL has a named owner and QA status.	**SEO**

Do not spend the first week on

Bulk content

More thin pages increase the review surface and can dilute trust.

Manual submission of 167 URLs

Submit a complete sitemap and manually request only the strongest sample.

Cosmetic SEO scores

A plugin score cannot replace index evidence, accuracy or authority.

Week-one exit gate: no known P0 accuracy defects remain; the sitemap reflects the approved inventory; all sampled URLs pass live indexability tests; the owner can see authoritative coverage reports in GSC and Bing.

Build quality in 30 days, then earn authority over the next 60

DAYS 8-30

Create a reviewed core

- Complete the 167-URL QA inventory and assign index/noindex/consolidate decisions.
- Select 10-20 flagship pages across two or three defensible clusters.
- Rewrite those pages with unique intent, examples, limitations, screenshots/tests and related guides.
- Add real authorship, reviewer credentials where needed, corrections, methodology and update history.
- Strengthen category hubs and breadcrumbs; make crawl depth measurable.
- Add accurate Organization/WebSite, Breadcrumb and Article markup where appropriate.
- Run performance baselines by template and fix measured regressions.

DAYS 31-90

Create demand and evidence

- Publish two to four original benchmark/methodology assets, not generic listicles.
- Offer carefully designed embeds for genuinely reusable tools with optional attribution.
- Run targeted outreach to educators, developers, privacy communities and resource curators.
- Expand only page patterns that gain impressions, qualified links or repeat tool usage.
- Refresh high-stakes calculators when official rules change; preserve a dated change log.
- Use IndexNow for real additions/updates/deletions and monitor Bing diagnostics.
- Re-audit duplicate titles, thin pages, broken equations and template regressions monthly.

Weekly operating dashboard

KPI	Source	Healthy direction	Diagnostic question
Valid indexed pages	GSC + Bing	Rises toward the approved indexable inventory.	Are valuable URLs excluded or weak URLs indexed?
Search impressions	GSC/Bing performance	Rises first on non-brand long-tail queries.	Which pages are discovered but not competitive?
Clicks and CTR	GSC/Bing performance	Clicks grow; CTR judged by query/position.	Does the snippet promise match the page?
Tool completions	Privacy-respecting analytics	Higher successful completion, lower errors.	Is organic traffic actually accomplishing the task?
Referring domains	GSC/Bing + backlink tool	New relevant editorial domains.	Which proof assets attract links?
Core Web Vitals	CrUX/GSC	At least 75% of visits in “good” thresholds.	Which template/device is failing?
Crawl/index errors	GSC/Bing/logs	Zero systemic errors; exceptions explained.	Did a deploy change status, robots or canonical?

Leading indicator order: submitted/known URLs → crawled URLs → indexed URLs → impressions → qualified clicks → tool completions → editorial links. Ranking position without this context is a noisy vanity metric.

Decision rule after 30 days

If a page is technically eligible but receives no impressions, compare intent and value against the ranking pages before rewriting. If it earns impressions but few clicks, test title/snippet alignment. If it earns clicks but poor completion, fix the tool or explanation. Do not prescribe the same remedy to every stage.

The URL inventory is the control plane for the entire recovery

Create one row per route. This prevents silent drift between content, metadata, sitemap inclusion and functional accuracy, and gives every issue a named owner.

Column	Pass condition	Example action when failed
Final URL + status	Preferred HTTPS host; HTTP 200.	Remove chain/soft 404; redirect obsolete variants once.
Index decision	Explicit: index, noindex, consolidate or retire.	Do not let every generated route default to index.
Canonical	One absolute self-canonical for indexable pages.	Align host/path/trailing slash with final URL.
Sitemap	Included iff indexable; accurate lastmod.	Generate from the same route record.
Title + H1	Unique, intent-specific, one visible H1.	Replace generic template strings; add missing H1.
Useful body	Method, example, limits and next step are page-specific.	Rewrite, merge or noindex thin/duplicative pages.
Accuracy tests	Known inputs pass; edge cases documented.	Block deploy on regression, especially YMYL tools.
Reviewer/source	Named and current where stakes require it.	Remove unsupported claim until reviewed.
Internal links	At least one hub inlink; contextual related links.	Add to category and relevant guides.
Structured data	Valid and identical to visible content.	Remove unsupported types/properties.
Performance	Template benchmark recorded; no regression.	Investigate bundle/main-thread/image cause.
Search outcome	GSC/Bing status and query data recorded weekly.	Diagnose discovery, indexing, relevance or UX stage.

Definition of “ready to index”

A user can arrive from search, complete the task, understand the result, verify assumptions, navigate onward and trust who stands behind the page.

Definition of “not ready”

A page is technically reachable but templated, inaccurate, unsupported, redundant, broken after rendering or unable to explain its result.

Bottom line: Yuitility already has product breadth. The ranking opportunity comes from turning a small portion of that breadth into a demonstrably reviewed, crawlable and cited reference set - then expanding only where evidence shows traction.

Sources and audited pages

Public pages and documentation consulted for the findings and recommendations. Site observations reflect the fetched content available on 25 September 2026.
